BA INSIGHT

Our connectivity software makes it possible for businesses across all industries to connect Office 365 to various enterprise systems to implement intranets with internet-like search experiences. Unlike other approaches, our off-the-shelf software is easy to implement, replacing costly customization projects and simplifying upgrades.

WHAT WE OFFER
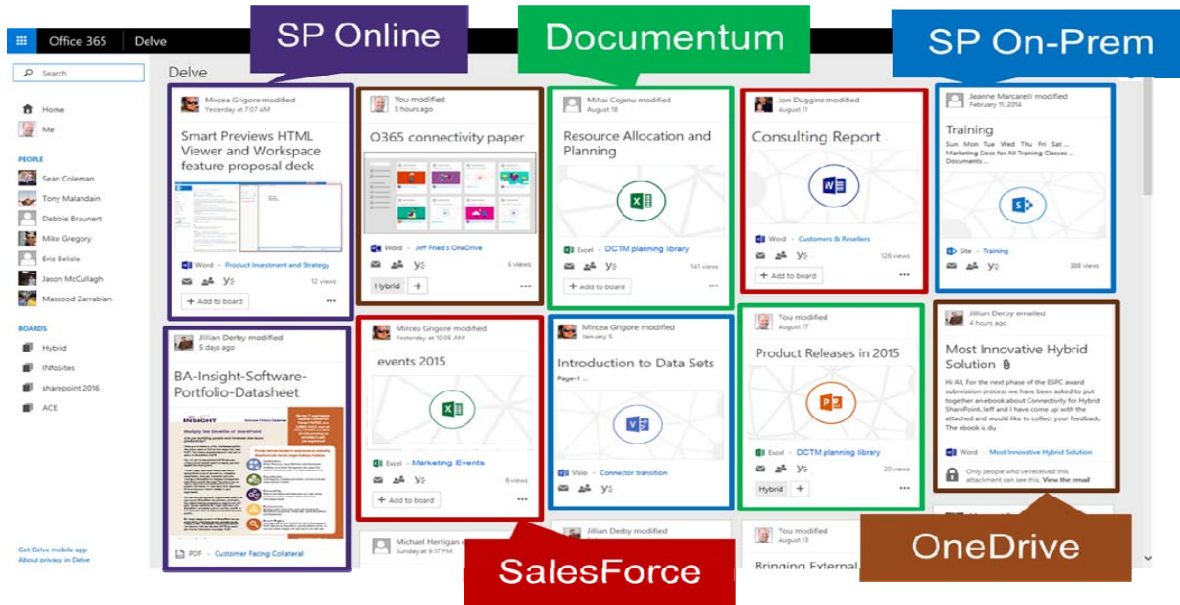

Our SharePoint Connectivity Software feeds content from over 60 enterprise systems into Office 365. It leverages Microsoft's Cloud SSA and feeds the search, Delve, and Office 365 Data Loss Prevention (DLP) workloads to provide unified experiences across all content enterprise-wide. It is flexible, spanning not only Office 365, but also SharePoint on-premise and SharePoint in Azure IaaS. Most deployments will use a single unified index hosted in Office 365. Users can therefore explore and work with content without knowing or being concerned with where it resides. Our software also manages sophisticated security scenarios, maps security entitlements with source systems into search, and ensures results are trimmed to expose only content the user has access to.

Our Connector Framework is the central hub for all of this content, sending it to the Cloud SSA, which parses the files and sends indexable text and metadata to Office 365. A service within O365 receives this content, processes it for indexing, and sends it to the O365 Search Index. All experiences that use search automatically gain access to this external content. Content indexed via the Cloud SSA is also in the Office Graph and visible through Delve. This content is also scanned by the Office 365 DLP features in the same way as SharePoint Online content, and issues will be reported in the Compliance Center within O365.

WHAT OUR CUSTOMERS ARE SAYING

"To see everything light up from all our SharePoint business solutions in one search results page in cloud is pretty spectacular. Looks like we now have the largest hybrid search index in the world ." – Kevin Spreadbury, Solutions Architect, Vodafone

Microsoft | Go-To-Market Services

Our Connectors provide secure SharePoint integration with over 60 enterprise systems, without custom code. Users are able to easily search and bring external content into the Office 365 index, regardless of where the content resides.

KEY USE CASES

INCREASE PRODUCTIVITY
Information silos don't allow for easy or rapid access to information, often resulting in duplication of efforts. By providing a single access point to a unified view of information across multiple systems, employees become much more productive and don't have to "reinvent the wheel" with each new project.

EFFECTIVE M&A INTEGRATION
Mergers and acquisitions are prevalent in today's environment, but often lead to additional challenges with information access. Connectors enable knowledge to be available company-wide, regardless of the application or where the information resides.

IMPROVE CUSTOMER SERVICE
Being able to quickly and reliably access needed information enables a faster response time to customers and other constituents, providing a more satisfactory customer experience.

ELIMINATE INFORMATION SILOS
Content from various external sources is brought into the Office 365 index so that users have unified access to the information they need to do their jobs.

CONNECT TO OVER 60 DIFFERENT SYSTEMS
This includes content and collaboration platforms, mailbox and archiving systems, enterprise portals, CRM systems, databases, and search and cloud systems.

HONOR SECURITY OF SOURCE SYSTEMS
Smart Security Mapping provides powerful security integration across the heterogeneous security schemes used by different source systems.

FUTURE-PROOF YOUR INVESTMENT OF O365
BA Insight keeps its connectors up to date for O365 and SharePoint on-premise. Upgrades can easily be done by a company's IT organization.

EXPERT IMPLEMENTATION SERVICES
Our team can provide expert guidance on the configuration of managed and crawled properties and how these properties can enhance the search experience.
